

# Chapter 6

## Differentiation

It's time for calculus!

**Definition 6.1.** Let  $f : A \rightarrow \mathbb{R}$  be a function and let  $a \in A$ . For real number  $D$ , we say that  $f$  has *derivative*  $D$  at the point  $a$  if the following two conditions hold:

1. The point  $a$  is an accumulation point of the domain of  $f$ .
2. If  $S$  is an open interval containing  $D$ , then there is an open interval  $T$  containing  $a$  such that if  $t \in T$ ,  $t \neq a$ , and  $t$  is in the domain of  $f$ , then

$$\frac{f(t) - f(a)}{t - a} \in S.$$

In this case, we say that  $f$  is *differentiable* at  $a$ . If  $f$  does indeed have a derivative at some points in its domain, then the derivative of  $f$  is the function denoted by  $f'$ , such that for each number  $x$  at which  $f$  is differentiable,  $f'(x)$  is the derivative of  $f$  at  $x$ .

Note that the definition of derivative automatically excludes the kind of behavior we saw with continuous functions, where a function defined only at a single point was continuous.

**Exercise 6.2.** Explain why any function defined only on  $\mathbb{Z}$  cannot have a derivative.

**Exercise 6.3.** Find and prove a formula for the derivative of  $f(x) = 3$ .

**Problem 6.4.** Find and prove a formula for the derivative of  $g(x) = 2x - 5$ .

The following problem provides an alternative definition for the derivative.

**Problem 6.5.** Let  $f : A \rightarrow \mathbb{R}$  be a function and let  $a \in A$ . Prove that  $f$  has derivative  $D$  at the point  $a$  if and only if the following two conditions hold:

1. The point  $a$  is an accumulation point of the domain of  $f$ .
2. If  $\epsilon > 0$ , then there exists  $\delta > 0$  such that if  $t$  is in the domain of  $f$  and  $|t - a| < \delta$ , then

$$\left| \frac{f(t) - f(a)}{t - a} - D \right| < \epsilon.$$

**Problem 6.6.** Find the derivative of  $h(x) = x^2 - x + 1$  at  $x = 2$ .

**Problem 6.7.** Find the derivative of  $h(x) = x^2 + ax + b$  for any  $a, b \in \mathbb{R}$ .

**Problem 6.8.** If  $f$  is differentiable at  $x$  and  $c \in \mathbb{R}$ , show that the function  $cf$  also has a derivative at  $x$  and  $(cf)'(x) = cf'(x)$ .

**Problem 6.9.** If  $f$  and  $g$  are differentiable at  $x$ , show that the function  $f + g$  also has a derivative at  $x$  and  $(f + g)'(x) = f'(x) + g'(x)$ .

**Problem 6.10.** Suppose  $f$  and  $g$  are differentiable at  $x$ . Prove each of the following:

(a) The function  $fg$  is differentiable at  $x$ . Moreover, its derivative function is given by

$$(fg)'(x) = f'(x)g(x) + f(x)g'(x).$$

(b) The function  $f/g$  is differentiable at  $x$  provided  $g'(x) \neq 0$ . Moreover, its derivative function is given by

$$\left(\frac{f}{g}\right)'(x) = \frac{f'(x)g(x) - f(x)g'(x)}{[g(x)]^2}.$$

**Definition 6.11.** Let  $f : A \rightarrow \mathbb{R}$  be a function and let  $a \in A$ . The non-vertical line  $L$  is *tangent* to the function  $f$  at the point  $P = (a, b)$  means that:

1.  $a$  is an accumulation point of the domain of  $f$ ,
2.  $P$  is a point of  $L$ , and
3. if  $A$  and  $B$  are non-vertical lines containing  $P$  with the line  $L$  between them (except at  $P$ ), then there are two vertical lines  $H$  and  $K$  with  $P$  between them such that if  $Q$  is a point of  $f$  between  $H$  and  $K$  which is not  $P$ , then  $Q$  is between  $A$  and  $B$ .

If  $L$  is tangent to  $f$  at  $P$ , we say that  $L$  is a *tangent line* to  $f$  at  $x = a$ .

In the previous definition we write that we have three distinct lines,  $A$ ,  $B$ , and  $L$  with  $L$  between  $A$  and  $B$  (except at  $P$ ). By this we mean that for any point  $l$  on  $L$  (except  $P$ ) there is a point  $\alpha$  on  $A$  and a point  $\beta$  on  $B$  so that either  $\alpha$  is below  $l$  which is below  $\beta$  or that  $\beta$  is below  $l$  which is below  $\alpha$ .

**Exercise 6.12.** Try to draw a picture that captures the definition of tangent line. Your picture should include  $f$ ,  $a$ ,  $f(a)$ ,  $P$ ,  $L$ ,  $A$ ,  $B$ ,  $H$ ,  $K$ ,  $Q$ ,  $\alpha$ , and  $\beta$ .

**Problem 6.13.** Let  $f : A \rightarrow \mathbb{R}$  be a function and let  $a \in A$  such that  $f$  has a tangent line at  $x = a$ . Prove that  $f$  does not have two tangent lines at the point  $(a, f(a))$ .

**Problem 6.14.** Define  $f : \mathbb{R} \rightarrow \mathbb{R}$  via  $f(x) = |x|$ .

- (a) Prove that  $f$  is continuous on all at all points in its domain.
- (b) Prove that  $f$  has a (non-vertical) tangent line at all points in its domain except  $x = 0$ .

**Problem 6.15.** Use the definition of tangent to show that if  $f$  is a function whose domain includes  $(-1, 1)$ , and for each number  $x \in (-1, 1)$ ,  $-x^2 \leq f(x) \leq x^2$ , then the  $x$ -axis is tangent to  $f$  at the point  $(0, 0)$ .

**Problem 6.16.** Let  $f : A \rightarrow \mathbb{R}$  be a function and let  $a \in A$ . Prove that  $f$  has a derivative at  $x = a$  if and only if  $f$  has a non-vertical tangent line at the point  $(a, f(a))$ .

The upshot of Problems 6.13 and 6.16 is that derivatives are unique when they exist.

**Problem 6.17.** Let  $f : A \rightarrow \mathbb{R}$  be a function and let  $a \in A$  and suppose  $f$  has a derivative at  $x = a$ . Explain why  $f'(a)$  is the slope of the line tangent to  $f$  at the point  $(a, f(a))$ .

In light of Problem 6.16, if a function  $f$  does not a tangent line or has a vertical tangent line at  $x = a$ , then  $f$  is not differentiable at  $x = a$ . Note that Problem 6.14 shows us that if a function  $f$  is continuous at  $x = a$  may or may not be differentiable at  $x = a$ . This problem also illustrates that a function  $f$  and its derivative  $f'$  might not have the same domain. However, the next problem tells us that differentiability implies continuity.

**Problem 6.18.** Show that if  $f$  has a derivative at  $x = a$ , then  $f$  is also continuous at  $x = a$ .

More coming soon...
